Confirmation of Clinical Necessity

(Passport No. 550520263)

Patient Name: Lauren Elizabeth Campbell

To Whom It May Concern,

This form serves to confirm the clinical necessity for the placement of an implant on tooth 46 for Ms. Lauren Campbell. Based on thorough clinical and radiographic evaluation, the decision to place a one-piece implant at this location was made due to the following reasons:

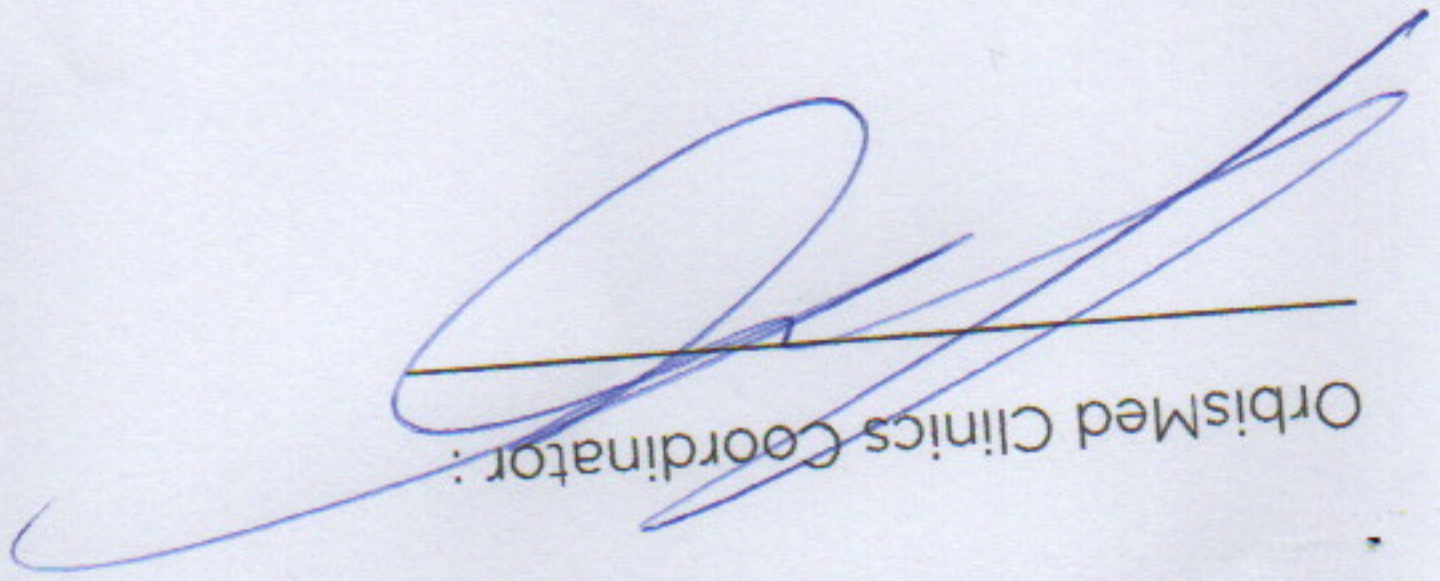

The molar position of tooth 46 in the lower right quadrant requires restoration to maintain proper occlusion and prevent functional problems such as impaired chewing efficiency. After evaluating the area, it was determined that the placement of a dental implant is the optimal solution to restore function and ensure long-term stability.

The implant is necessary to prevent bone resorption in the edentulous area, as missing teeth lead to a reduction in jawbone density over time. In the case of tooth 46, the implant was selected to provide a stable foundation, as it will help preserve the integrity of the surrounding bone and prevent shifting of neighboring teeth. Without this restoration, further complications like bone deterioration and potential misalignment of adjacent teeth could occur.

Additionally, placing an implant at tooth 46 restores proper occlusal contact and contributes to the patient's overall oral health and function. The implant also allows for the integration of a prosthetic crown or other restoration, ensuring the tooth can withstand normal chewing forces, as opposed to temporary or less stable alternatives.

In conclusion, the implant at tooth 46 is essential for maintaining the patient's oral health, functionality, and overall dental stability. Should you require further clarification or additional details, please feel free to contact us.
