

IMPLANT-SUPPORTED CROWN – INFORMED CONSENT

This document explains the nature, risks, limitations, and responsibilities related to implant-supported crown treatment.

Treatment Description

An implant-supported crown is a prosthetic tooth attached to a dental implant. Dental implants lack periodontal ligaments and therefore respond differently to chewing forces.

Risks & Complications

Possible risks include crown or screw loosening, ceramic fracture or chipping, implant overload, peri-implant inflammation or infection, bone loss, and aesthetic limitations.

Occlusion & Bruxism

Bruxism, clenching, or failure to use a prescribed night guard significantly increases the risk of complications and is not covered under warranty.

Warranty Limitations

Patient-related factors, biological changes, trauma, smoking, alcohol or substance abuse, poor oral hygiene, and lack of maintenance are not considered clinical errors.

Patient Responsibility

Long-term success depends on regular check-ups, professional cleanings, and strict oral hygiene.

Patient Acknowledgement

I confirm that I have read, understood, and accept the information above.
