

PATIENT INFORMATION & ACKNOWLEDGEMENT FORM

Case-Specific / Informal Medical Explanation

Patient Name: Lee Connell **Passport Number:** 155035797

Due to severe bone deficiency in both the upper and lower jaws, implant placement options were extremely limited. In the upper jaw, four (4) implants were placed and have successfully integrated. In the lower jaw, only two (2) implants could initially be placed due to insufficient bone volume.

During the second visit, one of the lower jaw implants failed and became exposed through the soft tissue. This implant was removed, and due to limited remaining bone adjacent to the failed site, a new implant was placed in an alternative position.

Immediate loading in the lower jaw is NOT possible due to bone quality and previous implant failure. Healing time is mandatory, and the patient is scheduled for a third visit.

The patient has been clearly advised to strictly avoid alcohol consumption, especially during the first healing month, as alcohol significantly increases the risk of implant failure. The patient has also been advised to undergo a Hemoglobin A1c (HbA1c) test to assess possible undiagnosed diabetes.

The patient has been clearly informed that this represents the FINAL opportunity for implant success in the lower jaw. If the newly placed implant fails, remaining options will be extremely limited.

If further implant failure occurs in the lower jaw, the patient understands that the remaining options are either a removable complete denture, or bone harvesting from the hip (iliac bone graft), followed by bone transplantation, prolonged healing, subsequent implant placement, and additional healing before prosthetic treatment.

All additional surgical procedures, bone grafting, re-implantation, and alternative treatments are NOT covered under any warranty and will involve additional costs.

While zygomatic implants may still be considered for the upper jaw if required, there are no further alternative solutions available for the lower jaw beyond those stated above.

Strict compliance with medical advice, oral hygiene, alcohol avoidance, and follow-up visits is essential. Failure to comply significantly increases the risk of implant failure and releases the clinic from clinical responsibility.

Patient Acknowledgement

I confirm that I have been fully informed about my clinical condition, treatment limitations, risks, and alternative treatment options. I understand that implant success cannot be guaranteed in my case and that further failures are not covered under warranty. I accept all information provided above.
